

# Development Plan

Requirements: load in the mini cooper data through js and php and have more data that appears on a click. Accomplish the display of data with the vue js library. Otherwise have a semi complete and decent looking webpage to present everything nicely.

Plan: Use Vue to bring in the data from the database, load it into a container, display the image, of the vehicle and model name in a vehicle section using a vue loop in the index, create a function to show the data if the user clicks on the corresponding image name or more info prompt, any section of it will work but the more info tells the user that it's an option, info can change based on what is clicked as the data populates the same area. Style up the whole page with a tiny bit of extra content.
